Resik S.W.;

Rationale for Bcl-xL/Bad peptide complex formation from structure,

mutagenesis, and biophysical studies.";

R. Protein Sci. 9:2528-2534(2000).

-- FUNCTION: Promotes cell death. Successfully competes for the

Dinding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level

of heterodimerization of these proteins with BAX. Can reverse the

death repressor activity of Bcl-x(L), but not that of Bcl-2 (By

similarity). Appears to act as a link between growth factor

receptor signaling and the apoptotic pathways.

C. receptor signaling and the apoptotic pathways.

C. SUBUNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-

x(L), Bcl-2 and Bcl-w. Also binds protein S100Al0 (By similarity).

The Ser-75/Ser-99 phosphorylated form binds 14-3-3 proteins (By

-!-SUBCELLUAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.
-!-TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.
-!-DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the BCl-2 family.
-!-PTM: Phosphorylated on Ser-75 in response to survival stimuli. Subsequent phosphorylation on Ser-99 promotes heterodimerization with 14-33 proteins. This interaction then facilitates the phosphorylation at Ser-118, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the major site of protein kinase A (CAPK) phosphorylation (by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: Contains 1 Bcl-2 homology 3 (BH3) domain.
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
CAUTION: Ref.1 sequence differs from that shown due to frameshifts in position 64 and 91.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PHOSPHORYLATION (BY PKA AND PKB) (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (BY

Mol. Cell 6:41-51(2000).

-!-FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-x(1, Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with Bax. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2. Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-!- Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-!- SUBGNIM: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein $100A10 (By similarity).

The Ser-112/ser-136 phosphorylated form binds 14·3-3 proteins.

-!- SUBCELLUAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

-!- DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

-!- PTM: Phosphorylated on Ser-112 in response to survival stimuli.

-!- TH: Also appropriated on Ser-112 in response to survival stimuli.

-!- TH: Also appropriated on Ser-112 in response to survival stimuli.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-155, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-136 is the major site of AKT/PKB phosphorylation, Ser-155 the major site of protein kinase A (CAPK) phosphorylation.

Mol. Cell. Neurosci. 17:97-106(2001).

-!-FUNCTION: Promotes cell death. Successfully competes for the binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

-!- SUBGNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein $100A10. The Ser-1137 phosphorylated form binds l4-3-3 proteins.

-!- SUBCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolde035147-2; Sequence=VSP_000534;
Isolde035147-2; Sequence=VSP_000534;

Lisource SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more abundant form.

-!- DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

-!- PTM: Phosphorylated on Ser-133 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14.3-3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LPRPKSAGTATQMRQSASWTRIIQSWWDRNLGKGGSTPSQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -:- CATALYTIC ACTIVITY: Homogentisate + O(2) = 4-maleylacetoacetate.
-:- COFACTOR: Iron (By similarity).
-:- PATHWAY: Catabolism of tyrosine; third step.
-:- PATHWAY: Catabolism of phenylalanine; fourth step.
-:- SIMILARITY: Belongs to the homogentisate dioxygenase family.

-!- FUNCTION: BY HYDROIYSIS OF THE ATTACHED GIYCOLIPID, RELEASES
SOLUBLE VARIANT SURFACE GLYCOPROTEIN CONTAINING PHOSPHOINOSITOL
FROM THE CELL WALL OF T.BRUCEI AFTER CELL LYSIS. IT ALSO CLEAVES
SIMILAR MEMBRANE ANCHORS ON SOME MAMMALIAN PROTEINS. VSG LIPASE
MAY PLAY A ROLE IN PROCESSES SUCH AS PARASITE DIFFERENTIATION OR
ANTIGENIC ACTIVITY: Variant-surface-glycoprotein 1,2-didecanoyl-
sn-phosphatidylinositol + H(2)0 = 1,2-didecanoyldycerol + soluble
variant-surface-glycoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBUNIT: Monomer (By similarity).
SUBCELLULAR LOCATION: Membrane-associated.
SIMILARITY: DOMAIN X IS CONSERVED IN DIFFERENT FORMS OF PLC AND IS
ESSENTIAL FOR CATALYTIC ACTIVITY.
